

# Schooner

Full Season, Medium Vine  
Great Lakes Region

## NAVY BEAN

**Schooner** – Full Season, Medium Vine

### Profile:

Schooner is a reliable variety with a long history of consistent performance. This excellent canner has a reputation for starting strong and finishing strong, and holds its pods off the ground to avoid the costly effects of water damage. It has proven its adaptability and yielding power. Schooner germinates well in cool soils, matures evenly, and dries down uniformly.

### Economic Profile:

Assuming a 30 lbs./AC yield increase over Vista, coupled with a 3 day earlier maturity. Schooner can potentially increase your profit \$5/AC on \$17/cwt. beans and lower your risks associated with later maturing varieties. This can calculate out to an approximate \$500 on 100 AC of production.

### SCHOONER VS. VISTA\*

\*Data from the Great Lakes region

### TRIAL DATA

#### SCHOONER

<b>Approx. Maturity</b>	93-97 days
<b>Plant Type</b>	3B
<b>Approx. Seed Count</b>	2,352 seeds/lb.
<b>Disease Resistance</b>	<b>HR:</b> CI (Race 07) <b>IR:</b> BCMV ("1" gene)

\*See reverse side for disease resistance abbreviation chart

For customers around the world, ADM draws on its resources—its people, products, and market perspective—to help them meet today's consumer demands and envision tomorrow's needs.

# Schooner

Full Season, Medium Vine – NAVY BEAN

## KEY TO RESISTANCE ABBREVIATIONS FOR BEANS

<b>Plant Type 1A</b>	Bush determinate erect stem
<b>Plant Type 2A</b>	Erect growth indeterminate short runners
<b>Plant Type 2B</b>	Erect growth indeterminate with medium to long runners
<b>Plant Type 3B</b>	Prostrate vine indeterminate growth with long runners
<b>BCMV</b>	Bean common mosaic caused by the specified strains of Bean common mosaic virus
<b>BCTV</b>	Curly top caused by Beet curly top virus
<b>BGYMV</b>	Bean golden yellow mosaic caused by Bean golden yellow mosaic virus
<b>CI</b>	Anthrachnose caused by <i>Collectrichum lindemuthianum</i>
<b>Psp</b>	Halo blight caused by <i>Pseudomonas savastanoi</i> pv. <i>phaseolicola</i>
<b>Pss</b>	Bacterial brown spot caused by <i>Pseudomonas syringae</i> pv. <i>syringae</i>
<b>Ua</b>	Rust caused by the specified races of <i>Uromyces appendiculatus</i>
<b>HR</b>	<b>High Resistance:</b> describes plant varieties that highly restrict the growth and development of the specified pest or pathogen under normal pest or pathogen pressure when compared to susceptible varieties. Highly resistant varieties may, however, exhibit some symptoms or damage under heavy pest or pathogen pressure.
<b>IR</b>	<b>Intermediate Resistance:</b> describes plant varieties that restrict the growth and development of the specified pest or pathogen, but may exhibit a greater range of symptoms or damage compared to highly resistant varieties. Intermediately resistant varieties will still show less severe symptoms or damage than susceptible plant varieties when grown under similar environmental conditions and/or pest or pathogen pressure.

In cases where specific races or strains are not noted the variety is resistant to some, but not necessarily all known races or strains of the pathogen.
